

Jaw Crusher Liner HARD-Core Inserts

Makuri Jaw Crusher Liner HARD-Core Inserts offer average life improvements around 100% over basic manganese steel, while maintaining a comparable unit cost.

The liners utilise cast-in inserts containing a range of hard metal carbides such as titanium and tungsten. The inserts are cast using a unique process that places them below the surface of the liner, ensuring improved metallurgical bonding between the inserts and the base material.

This technology can be applied to all jaw liner types, although a small change in tooth profile is often beneficial to ensure maximum effectiveness.
